

Ancillary ECMO Products

Percutaneous Introducer Kit

Part: PCT

The PCT is designed to place the OriGen ECMO catheter percutaneously to minimize the cut-down on the jugular vein during cannulation. The needles, guidewires, and dilators are all matched to the size catheter that you are using during the procedure.

Percutaneous cannulation can reduce the need for post-ECMO wound treatment and often the site wound can be treated with a simple bandage instead of sutures.

PCT for use with VV13F, VV16F, VV19F, VV23F, VV28F, VV32F

Hemofiltration Tubing Set

Part: HFT

The transfer set is intended for draining fluids from the body. A set of three color coded tubes are to be connected to the correct line during ECMO. The tube set includes a venous drainage line (blue), an arterial drainage line (red), and an additional drain line (clear). Both arterial and venous lines have a sampling line with a side clamp. The drain line has a standard spike port if aseptic connection is desired.
